How to Create Scenarios from recorded messages

The Tosca OSV Monitor includes a recorder that you can use to record the traffic between your system under test and a real service. It records the requests and responses they exchange and allows you to create OSV Scenarios from them. OSV can use these Scenarios to continue testing even if the real service is unavailable.

To create an OSV Scenario from recorded messages, you need to perform the following steps:

1. Record the messages.
2. Create your Scenario:
   a. In the OSV Monitor
   b. In Tosca Commander
