# How to cleanup ExecutionList logs in Tosca

With everyday DEX and local executions, Tosca Workspace gets loaded with huge sets of Execution Logs. As a best practice, it suggested to clean up the logs every now and then.

To perform the cleanup activity we can utilize TQL queries to find the target objects.

TQL Query: =>SUBPARTS:ExecutionLogEntry[CreatedAt<="<Date before which the logs have to be cleared>"]

Refer the screenshot below:

1. Perform TQL query on Execution Root Folder.

2. Select All from the query results and perform Delete.

3. Run the TQL query again and verify no results are found.
